How to send a password securely

This is Karen Leslie. I'm your WordPress fairy godmother on how to send passwords. Maybe you set me up at the back end of your WordPress website. But you want to send me the password anyway.

You don't have to, but maybe that's how you wanted to do it. Or maybe it's the username and password for another system that you're using that you want me to have access to.

You can email me the username and text me the password, but then what happens is that the password is on my phone and I need it on here on my computer. So another way of doing this is what I'm gonna show you now. It's called the PW push. I'm just gonna share the screen.

So this is just gonna hide me and I'm just gonna hide the meeting controls.

So this is It's if you type in pwpush.com.

And as it says, that password you just emailed, it's going to live there forever.

So you can actually use it free. You don't have to sign up for anything. It doesn't have to have your password. This can have email.

Password. You could have at the top website.

You can have a message.

Even if I could spell the word amazing. You can say delete after and you can have so many different days here. So if you know that, I don't know, I'm away on holiday and it might take a while, you can say delete it after 1 week. You can also say how many views. So you could say the, you know, 1 person is going to view this and that's going to be it.

You could know that it's going to be 2 people, so you might give them a bit more chance to view. Now what you can do is have an unlock phrase.

So I'm not suggesting you use Fairy Godmother, by the way. I'm just using that as an example. You can have Fairy Godmother, but it's a phrase that the person at the other end you can hint to without giving away the unlock phrase. If that makes sense. So for this, the clue could be, Karen, this is you.

It could be the first name of your firstborn child, something the other person would know, something. So if you're sending this to me, it's something I would know. You could even text me. The unlock phrase so that they're not all together. And then you click on push it.

And that is the link that you would send me.

And it actually tells you here, the content will be deleted in 6 days or 6 views, whichever occurs first. You see a QR code you can use as well.

And it says here, you can view this push now, but it will burn a view.

So this, it would look like at the other end. If you had given me the passcode and I could spell, you put that in there. Now this is it. All the content is blurred out. It's clever, isn't it?

You can click to reveal it. Then you can copy to a clipboard.

Now when you copy it to a clipboard, you still want to be careful with what you do with it. I use a password manager, which you may have seen pop up a couple of times. So anything that is sent to me, I put into a password manager so it's secure. You don't want to have it still as an open text somewhere.

So PWPush is a quick and easy way to create a link with a passcode or phrase code, send the link that you copied Send them the passcode or passphrase a different way.

And then I've got all the information I need. And this is a secure way. It's much better than emailing, especially now that AI has access to emails.

They say that the AI is contained.

But I would prefer that somebody sent me a password, an email, or all the usernames through something like that, which we know is secure, than just sending them in an email.

That's it for this quick lesson. Keep shining as usual.
